

360 CHAINROLL chops and crimps stalks.

IMPROVED NITROGEN AVAILABILITY STARTS HERE

Create the right environment for soil microbes and nitrogen availability with a new approach to residue management. 360 CHAINROLL™ chops and crimps stalks, making residue more available to microbial breakdown for better soil health and nutrient availability. The advanced, patented design also leaves most sections connected – like a chain – for more stable residue pieces so you don't experience clusters of small, confetti-like residue that tie up nitrogen and impede seedbed preparation.

KEY FEATURES + Precision cutting + Precision sizing + Precision residue management

PREPARE FOR NEXT SEASON.

When you properly manage crop residue, you set yourself up for success in the next season. 360 CHAINROLL is uniquely designed to create ideal conditions for healthy emergence, healthy soil and healthy yields.

360 CHAINROLL IS DESIGNED TO HELP YOU DO JUST THAT BY:

- + Cutting stalks precisely for pickup by row cleaners for a clear seedbed
- + Crimping and scoring stalks to expose the interior to microbes
- + Sizing stalks for faster decomposition and microbial breakdown

Specially designed teeth for crimping the stalk.

The back of the claw allows residue to release easily.

ENGINEERED FOR PERFORMANCE.

Each pair of 360 CHAINROLL™ units is designed to work together for exact and specific lacerations in the stalk. The stalk rolls feature a combination of cutting flutes and chaining flutes. The interaction and rotation of the flutes create chain-like residue pieces by penetrating the pith and pulling out the cut to leave a significant area exposed for microbes to enter the stalk.

+ 360 CHAINROLL units directly replace old stalk rolls.

+ Retrofit is available for John Deere 40 Series, 90 Series and 600 Series corn head models

+ Additional model retrofit options will be available in 2016.

GET MORE OF
THE POTENTIAL
YOU PLANT.

360 CHAINROLL is part of a new approach to farming from 360 Yield Center. It's designed to provide crop management solutions at every turn – from planning and planting to midseason nutrient application and harvesting – giving you more control to significantly improve your yield.
